

Master Java by building real-world projects. Learn JavaFX, Spring Boot, REST APIs

Course content by [Denis Panjuta](#):

You'll learn Java through a structured path of 60 days, with each day introducing key topics and practical exercises:

- **Day 1-15:** Learn **Java fundamentals**, control statements, loops, arrays, and user input handling.
- **Day 16-20:** Dive into **object-oriented programming (OOP)** with inheritance, polymorphism, encapsulation, and interfaces.
- **Day 21-25:** Explore the **Java Collections Framework**, Exception handling, and best practices for clean, maintainable code.
- **Day 26-30:** Build **desktop applications with JavaFX**, using powerful UI components and animations.
- **Day 31-40:** Work with **Spring Boot** to build robust web applications and RESTful APIs. Learn **Git**, manage versions, and publish.
- **Day 41-50:** Integrate databases, create secure applications, implement session management, Implement Stateless and Scalable authentication, Role Based Access Control, and Making a robust backend microservice
- **Day 51-60:** Making REST calls from Java desktop apps, Handling Authentication from Desktop apps, creating an interactive expense tracker UI, Creating Sharable JAR file and using your own app

Project Highlights:

1. **To-Do Application:** Build a feature-rich task manager with JavaFX, learning how to develop interactive desktop applications with clean and maintainable code.
2. **Expense Tracker:** Develop a scalable, secure Expense Tracker using **Spring Boot** and **REST APIs**, where you'll manage data and user authentication.
3. **Building REST APIs:** Master API creation with **Spring Boot**, integrating database connectivity and security features
